

Predicting COVID-19 Using Demographic Data

Caroline Clark
Feras Atwal
James Lee

Can we predict COVID-19 severity using demographic data?

MAKING THE DATA
INTERACTIVE

Data Collection

County-level

Area

- Population Density

Demographics

- Age
- Gender
- Race

Economic Indicators

- Income Per Capita
- Household Income
- Median Worker Income

Health Indicators

- Obesity Rates

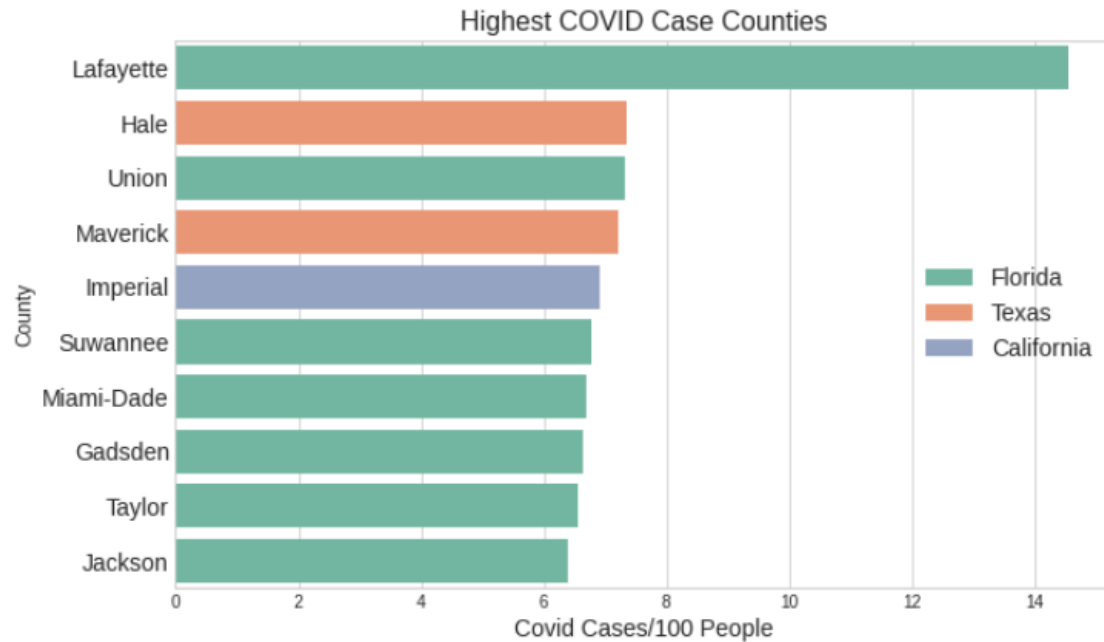

COVID-19

- Tests
- Cases
- Fatalities

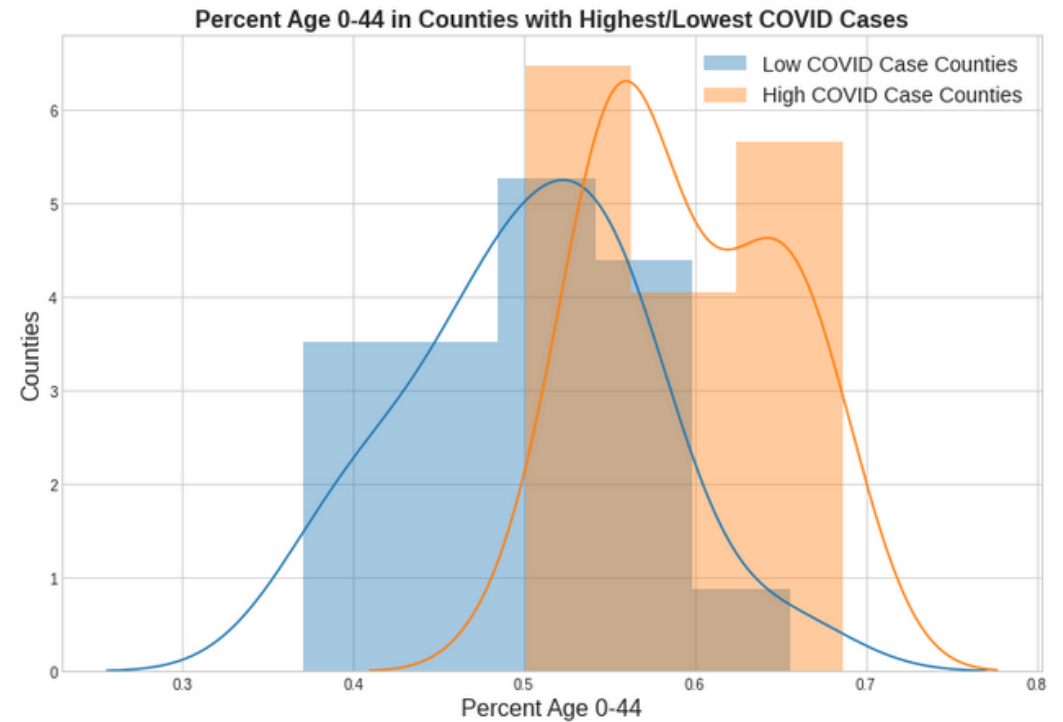

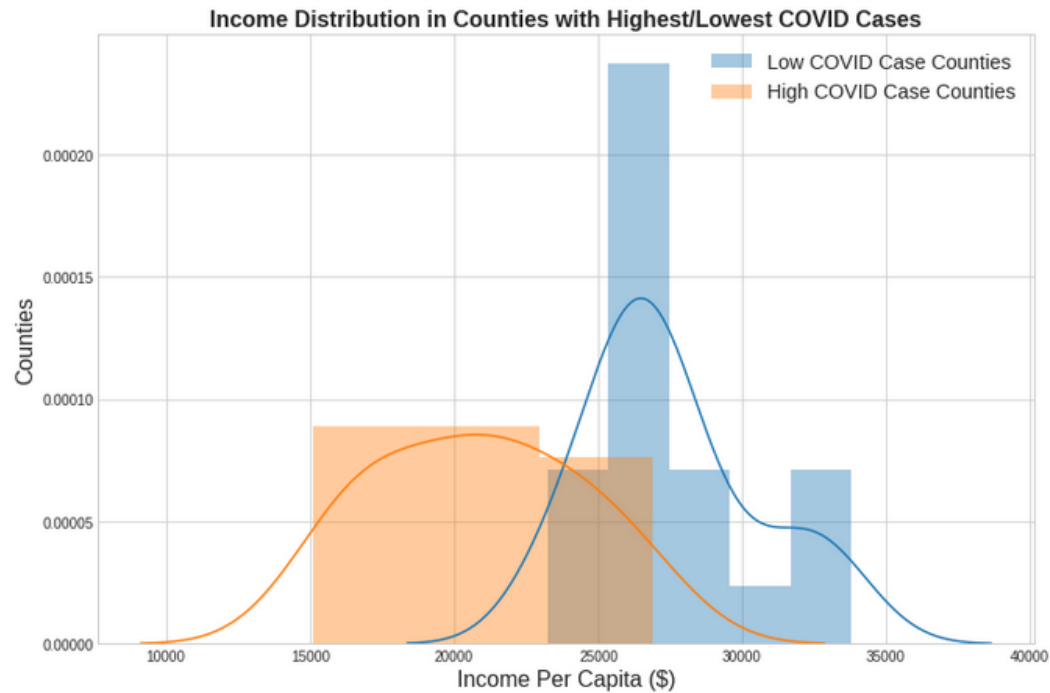

Five States
with the
Most
COVID-19
Data

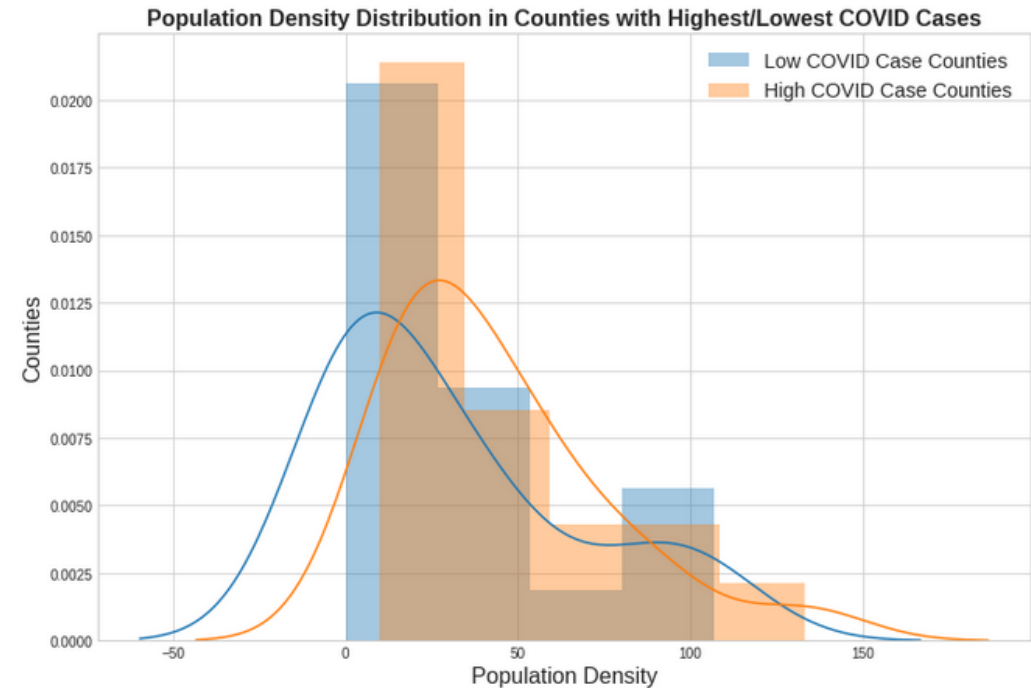

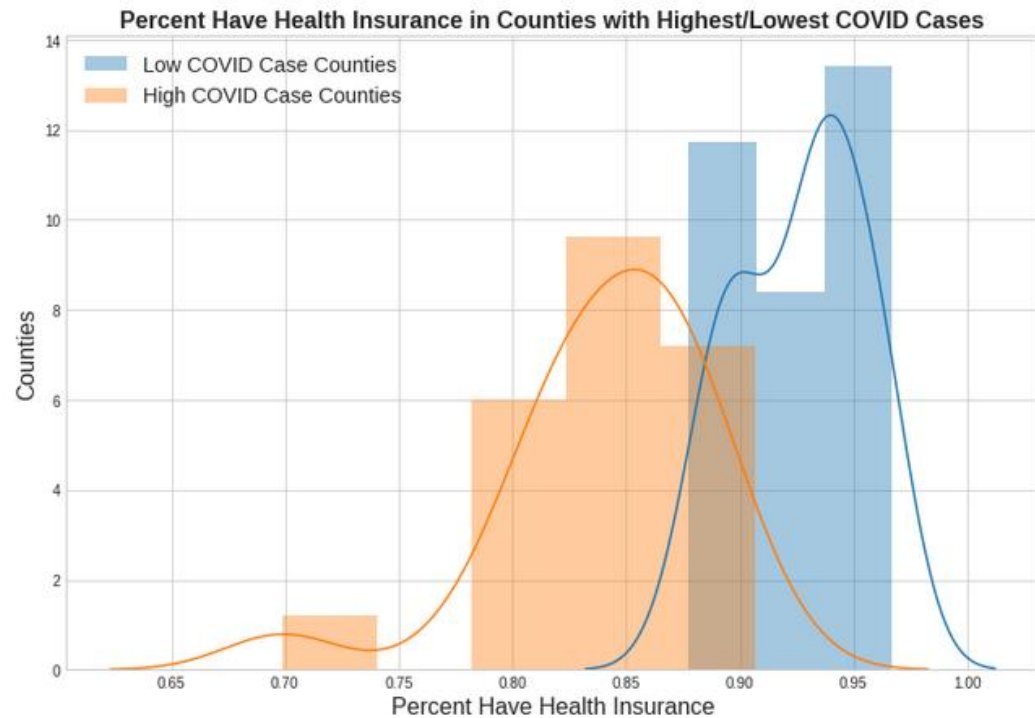

COVID Statistics Vary Widely

High COVID Case Counties Likely to be Younger, Have Lower Income Per Capita

Low COVID Case Counties Likely to have Insurance Coverage, Lower Pop. Density

Modeling Successes and Challenges

Region	Best Regression R2 Score	Best Classification Accuracy Score	Classification Baseline
All Five States	47%	63%	42%
California	75%	93%	66%
Florida	76%	71%	71%
Illinois	32%	73%	54%
New York	81%	94%	81%
Texas	49%	59%	40%

Population Density and Income the Strongest Factors for All Five States

In California, Testing and Race Emerged as Strongest Predictors

In Florida, Race Emerged as Strongest Predictors

Florida Model Coefficients

Florida Actual vs. Predicted Cases/100 People

In Illinois, Age and Being Insured Emerged as Strongest Predictors

In New York, Race and Age Emerged as Strongest Predictors

In Texas, Race and Income Emerged as Strongest Predictors

Conclusions and Key Challenges

Ongoing event

Widely varying data
